craftsman wireless garage door monitor 53696 manual

To view this site, you must enable JavaScript or upgrade to a JavaScriptcapable browser. Place anywhere in your home to monitor whether your garage door is closed or open. No need to get up in the middle of the night or after you are all tucked into bed to know if you remembered to close the door. The monitor can tell you with easy indicator lights red means it is open and green means it is closed. The Craftsman garage monitor is white in color so that you immediate see the monitor lights to know if the door is opened or closed. No second guessing. The monitor can be used with four separate garage doors with sensors sold separately. It weighs only 0.65 lbs so can be easily moved where you need it to be and comes with a oneyear general warranty. California residents See Proposition 65 information WARNING Cancer and Reproductive Harm WARNING WARNING This product contains chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. ADDITIONAL ACCESSORIES

Instead, our system considers things like how recent a review is and if the reviewer bought the item on Amazon. It also analyzes reviews to verify trustworthiness. Please try again later. That is a confused monitor constantly blinking from green to red. I had it plugged into a wall where several other WiFi items were plugged. Today I moved the monitor to an outside wall facing the garage. I have no idea whether the wall being closer to the garage or the outlet being UNEXPOSED to other WiFi items caused the monitor to work correctly. Perhaps Craftsman could pipe in to explain why the new location works since the lack of instruction leads to unhappy consumers. Bottom line, no more traipsing outside in the dark or inclement weather to check the garage door. When I decided to replace it, I did not read good reviews, so decided to try SkyLink instead. Bad decision. As soon as winter wet weather came in, SkyLink gave up the ghost and I finally just threw it away, and decided to try Craftsman again. It works like a charm and is always reliable. I love this product. Sent back for refund. The ordinary garage door opener works when the car is still several hundred feet from the house, so you know this technology exists, but I've never found a monitor that can go beyond about 20 feet unless it's line of sight. No matter where I place things, they just won't communicate. I did indeed have to return and was shopping for a replacement on this item but was able to find this at my local Sears store. They not only have it cheaper but in stock. I don't have to look at the garage to see if I closed it. Just look at the monitor. No problems with it so far. I like the compact design of the receiving unit. Think I just need to reprogram it to the sensor on the garage door but don't have a manual. Genie is a different company and the parts are not compatible. Btw, I'm available to help over the phone in case you need at Login to post Light flashes and door moves a few inches.

<http://ibeams.com/images/commax-dpv-4ke-manual.pdf>

We had a long power outage yesterday Do check your owners manual. Why does the opener keep blinking The blinking light should be red according to the instructions. Ours does that when power is interrupted. What does this mean. It is a Linear unit. I will assume you mean that your garage door will open with your remote but will not close. It should close if you press and hold the wall control button until the door is fully closed. If that is the case, the 3 blinking lights indicate that your garage doors infrared safety beams are not properly aligned. 1 Check that the operator has power. The green lights on the sender and receiver should be lit. 2 If the receivers green light is on, but the red light is off, the receiver has power but is not detecting the infrared beam from the sender. The red light might flash when the beam is partially detected. This can be caused by misalignment or something blocking the beam. Adjust the safety beam sender and receiver while watching the receivers red light stay out of the beam while aligning it. When the red light stays on, the beam is aligned and your garage door should operate normally. NOTE If the receivers red light remains off, check for 1 Dirt on the receivers lens, 2 Sunlight shining into the receivers lens, 3 A short in the safety beam wiring from staples or at the operator terminals. What does this mean. It is a Linear unit. I will assume you mean that your garage door will open with your remote but will not close. It should close if you press and hold the wall control button until the door is fully closed. If that is the case, the 3 blinking lights indicate that your garage doors infrared safety beams are not properly aligned. 1 Check that the operator has power. The green lights on the sender and receiver should be lit. 2 If the receivers green light is on, but the red light is off, the receiver has power but is not detecting the infrared beam from the sender.

<http://iacfhouston.com/images/commax-dpv-4pm2-manual.pdf>

The red light might flash when the beam is partially detected. This can be caused by misalignment or something blocking the beam. Adjust the safety beam sender and receiver while watching the receivers red light stay out of the beam while aligning it. When the red light stays on, the beam is aligned and your garage door should operate normally. NOTE If the receivers red light remains off, check for 1 Dirt on the receivers lens, 2 Sunlight shining into the receivers lens, 3 A short in the safety beam wiring from staples or at the operator terminals. Three blinking lights occur when we try to close door. What does this mean. It is a Linear unit. I will assume you mean that your garage door will open with your remote but will not close. It should close if you press and hold the wall control button until the door is fully closed. If that is the case, the 3 blinking lights indicate that your garage doors infrared safety beams are not properly aligned. 1 Check that the operator has power. The green lights on the sender and receiver should be lit. 2 If the receivers green light is on, but the red light is off, the receiver has power but is not detecting the infrared beam from the sender. The red light might flash when the beam is partially detected. This can be caused by misalignment or something blocking the beam. Adjust the safety beam sender and receiver while watching the receivers red light stay out of the beam while aligning it. When the red light stays on, the beam is aligned and your garage door should operate normally. NOTE If the receivers red light remains off, check for 1 Dirt on the receivers lens, 2 Sunlight shining into the receivers lens, 3 A short in the safety beam wiring from staples or at the operator terminals. One of them has a yellow light the other a green. The door starts to close than stops. You can close it if you hold the button down inside and the remote doesnt. Yellow and green are what the lights should be.

Does the led on the wall control blink If is does press the lock button. If it doesnt you will need to reprogram the remote. Watch the eyes as the door closes, does one of them go off. If so the track may be flexing causing misalignment. Widen the track near the bottom If all of the above dont help check the sensitivity adjustment. I grab hold of the red light sensor and squeeze and the light goes solid and I am able to close the garage door. when i let. You could also be moving the position of the sensor slightly into alignment when you squeeze the sensor. You will need to disconnect the wires for the sensor on the garage door opener or disconnect the power. Then use a flatblade screw driver and carefully separate the sensor case. Check for any loose connections on the wiring you might need to resolder the wire to the sensor eye. It sounds like a loose wire connection to me. It was working good and just stopped all at once. How do I know if I have a bad sensor or it is just out of alignment If the lights are on steady green they should show an unbroken line of sight. I have a similar problem and have the sensors duct taped together with the green light on constantly and it still wont go down. Light flashes and door moves a few inches. We had a long power outage yesterday Red and green lights blinking after power outage. Answer questions, earn points and help

others. Login to post When the infrared safety sensors are malfunctioning, usually one of the sensor lights will be blinking or a blinking red light will show rather than green or amber. The sensor lights need to be solid and not dim or flickering. When the sensors are at fault, the remotes cannot close the garage door; they can only open it. You may find that the door will only move an inch or so in the close direction. When this happens, your garage door will only close by holding down on the wall button until the door fully closes. This method is the only way to override the safety sensors and close the door.

This is also a direct clue that the safety sensors are the problem. Also, try unplugging the garage door opener and replugging the unit back into the outlet. This can act as a reset and may reset the sensors. If none of this works then you may have to replace the sensors or possibly the logic board inside the motor unit. Ours does that when power is interrupted. What does this mean. It is a Linear unit. I will assume you mean that your garage door will open with your remote but will not close. It should close if you press and hold the wall control button until the door is fully closed. If that is the case, the 3 blinking lights indicate that your garage doors infrared safety beams are not properly aligned. 1 Check that the operator has power. The green lights on the sender and receiver should be lit. 2 If the receivers green light is on, but the red light is off, the receiver has power but is not detecting the infrared beam from the sender. The red light might flash when the beam is partially detected. This can be caused by misalignment or something blocking the beam. Adjust the safety beam sender and receiver while watching the receivers red light stay out of the beam while aligning it. When the red light stays on, the beam is aligned and your garage door should operate normally.
